Assignment

Intro

We want to write a system that allows our admins to submit a bunch of credit card numbers for validation.

Requirements

Build a front-end application that can do the following:

- Allow the user to submit credit card details, including the country that it is from.
- Check the specified country to make sure it doesn't exist in a list of banned countries.
- Make the list of banned countries configurable.
- If the card is valid – store it somewhere for the session.
- Display all the credit cards that have been captured during the session.
- Don't capture the same card twice.

Guidelines

Make use of 3rd party services if you want.

Add your application to a git repository and send that to us.

Don't hesitate to reach out to us if you have questions.

Good luck and have fun!
